

## Gaia Assembly Template

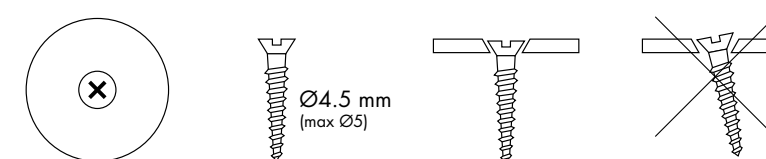

Gaia is easily installed using the integrated magnets and wall-mounted metal washers.

### Do as follows:

- A. Calculate the **height** and determine the section's distance from the floor to ceiling.
- B. Calculate the **width** and how far the section should be from one side of the room or the other.
- C. Decide on the location of the **start point**: It's a good idea to locate the start point in the centre of the lowest Gaia row with an odd number of panels (see illustration). Calculate the distance from the floor and mark the start point.
- D. Mark a **horizontal line** on the wall starting at the start point. We recommend using a laser.
- E. Place the installation template by aligning the horizontal line on the installation template with the horizontal line on the wall. Use the holes for marking. (Mark the additional holes if more Gaia's are being installed on the Left and/or Right side).
- F. Move the template sideways to mark out all the points along the horizontal line.
- G. Use the template to continue to mark out all the holes for installation on the wall.
- H. Fasten the metal washers to the wall. We recommend fastening the washers with screws. If you choose to tape them in place instead, the surface must be clean and dry and at a temperature between 21° C and 38° C for best adhesion.
- I. Now begin placing out Gaia on the wall by attaching the magnets to the metal washers. Begin with the row at the horizontal line and build from there. Each Gaia has markings at the side and top for aligning magnets with the appropriate vertical and horizontal line. Create different patterns by turning Gaia into the position you want. You have four positions to choose from.
